THE COST OF THE CONTROL LOOP

160s

Windows Computer Use · host agent

1.7s

Decisions Browser · DOM + fast model

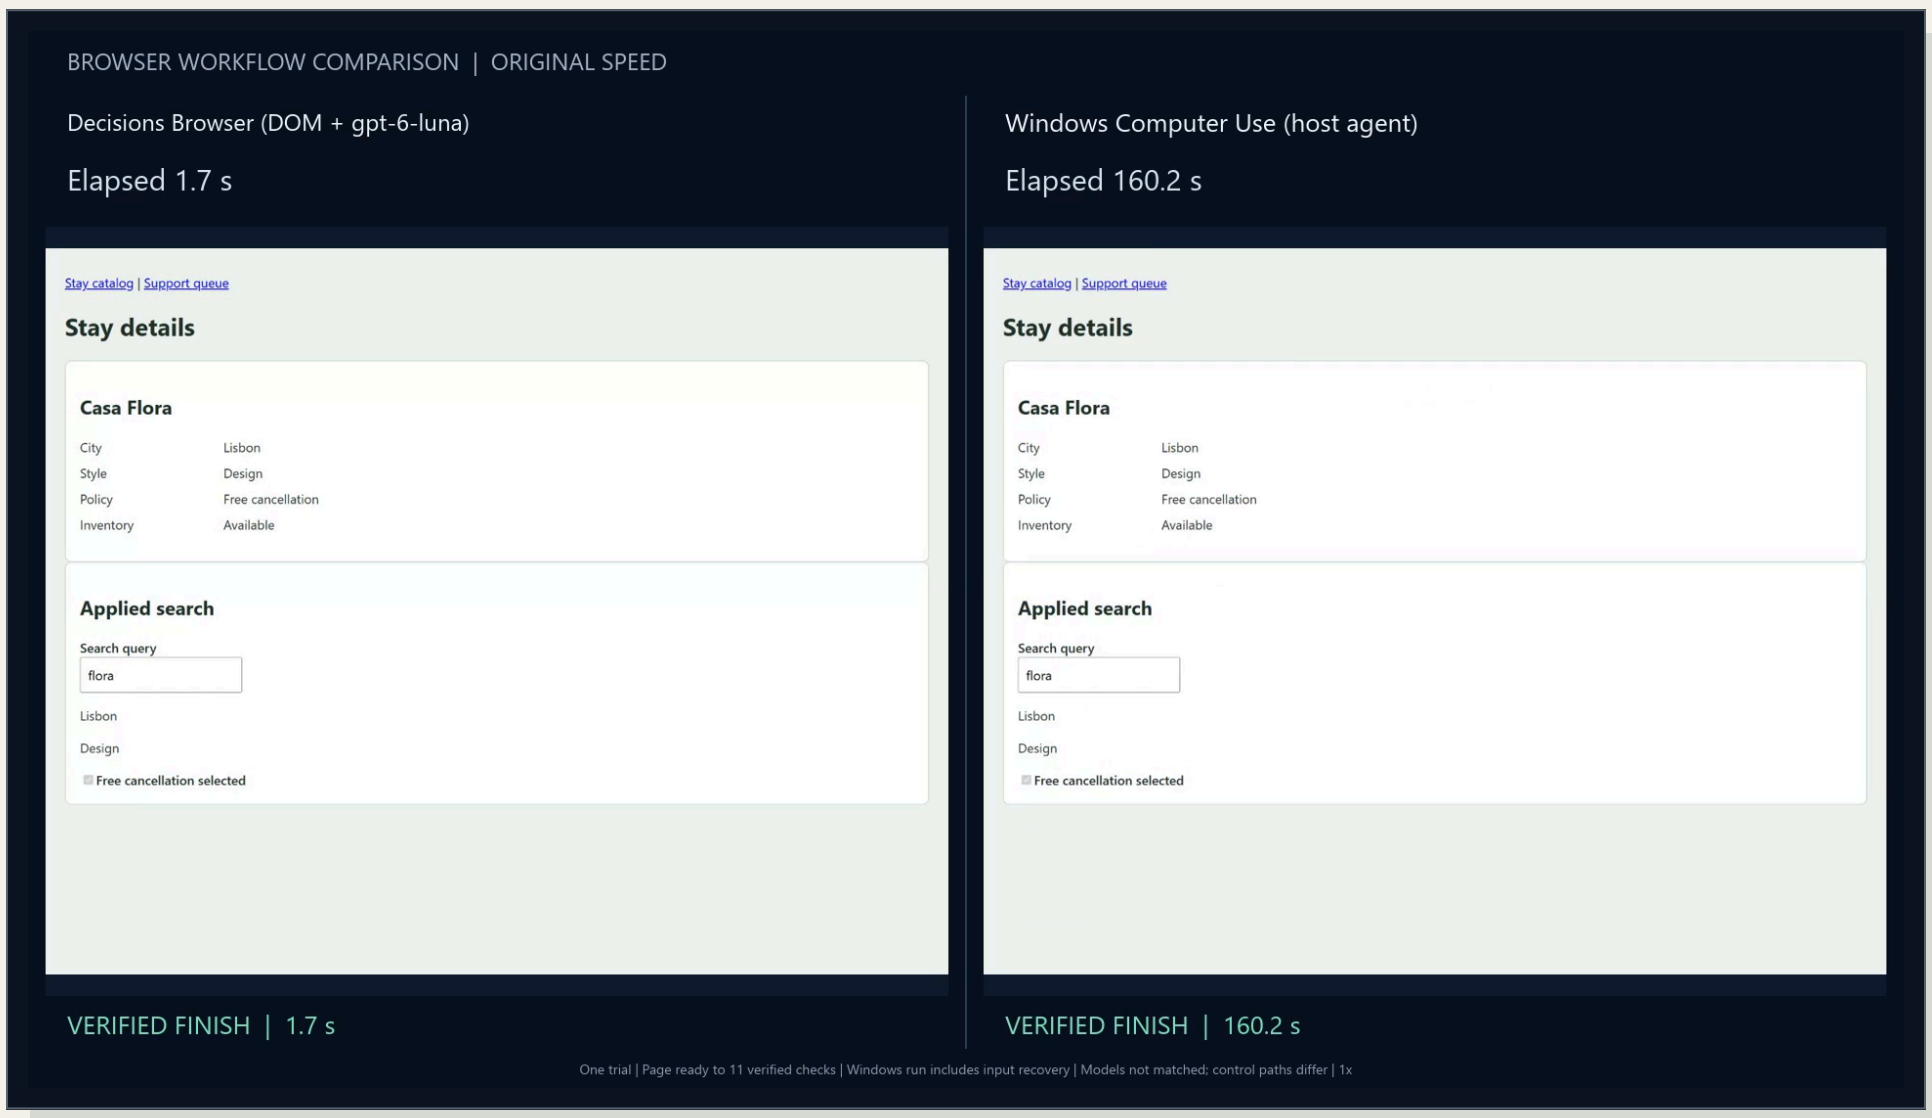

One recorded browser workflow.

Models not matched; control paths differ · setup excluded

Same outcome. 11 checks. Actual inputs.

Watch the run. Check the result.

Search. Set filters. Open the right record.

11 / 11 checks | **Original-speed capture**

One recorded browser workflow.

One local catalog task. Models not matched; control paths differ.
Windows run included input recovery. Setup excluded.

Real demo frame · no simulated UI

Bill Moore

Move the loop into the tool.

One MCP call owns a bounded workflow.

01 / THE CALLER

Goal + allowed text + completion checks

↓

02 / THE LOCAL HARNESS

Observe → choose → act

Finite action choices. A fast decision model.
Step limits, time limits and origin rules.

↓

03 / THE PROOF

Verify the actual browser state.

DOM + URL assertions decide completion.

The recorded result is a case study in harness design.
It is not a universal model benchmark.

FREE + OPEN SOURCE

Build a smaller loop.

Fork Decisions Browser.
Run the demo. Inspect the traces.
